#### AUTOPSY REPORT MEDICAR

#### EXTERNAL EXAMINATION

The body is that of a well-developed, well-nourished appearing, muscular, 74 inch tall male whose appearance is consistent with the reported age of 25 years. Lividity is present in the posterior dependent portions of the body, except in areas exposed to pressure. Upon initial examination, the body is frozen. Thewing is accomplished over four days. Rigor has passed, and the temperature is eventually that of ambient room.

The scalp is covered with straight black hair in a normal distribution. A beard is present. The irides are brown and the pupils are round and equal in diameter. No conjunctival petechiae are present. The external auditory canals are unremarkable. The ears are unremarkable. The nares are patent and the lips are straumatic. The nose and maxillae are palpably stable. The teeth appear natural and in good condition.

The neck is straight, and the traches is midline and mobile. The chest is symmetric. The abdomen is flat. The genitalia are those of a normal adult male. The testes are descended and free of masses. Pubic hair is present in a normal distribution. The buttocks and anus are unremarkable.

The upper and lower extremities are symmetric and without clubbing or edema. There is no external evidence of trauma.

#### CLOTHING AND PERSONAL EFFECTS

The following clothing items and personal effects are present on the body at the time of autopsy;

-Grey shirt

-Grey sweatshirt

-Orange jumpeuit

-White boxers

-2 pairs of socks, one white, one black

-Blanket

#### MEDICAL INTERVENTION

There is no evidence of recent medical intervention.

#### RADIOGRAPHS

A complete set of postmortem radiographs is obtained and demonstrates no evidence of skeletal trauma

#### EVIDENCE OF INJURY

There is no evidence of significant recent injury.

### AUTOPSY REPORT ME04-038

4

#### INTERNAL EXAMINATION

#### HEAD:

The galeal and subgaleal soft tissues of the scalp are free of injury. The calvarium is intact, as is the dura mater beneath it. Clear cerebrospinal fluid surrounds the 1300 gm brain, which has unremarkable gyri and sulci. Coronal sections demonstrate sharp demarcation between white and grey matter, without hemorrhage or contusive injury. The ventricles are of normal size. The basal ganglia, brainstem, cerebellum, and arterial systems are free of injury or other abnormalities. There are no skull fractures. The atlanto-occipital joint is stable.

#### NECK:

A separate layerwise dissection of the neck is performed. The anterior strap muscles of the neck are homogenous and red-brown, without hemorrhage. The thyroid cartilage and hyoid are intact. The larynx is lined by intact white muccas. The thyroid is symmetric and red-brown, without cystic or nodular change. The tongue is free of bite marks, hemorrhage, or other injuries.

#### BODY CAVITIES:

The ribs, stemum, and vertebral bodies are visibly and palpably intact. No excess fluid is in the pleural, pericardial, or peritoneal cavities. The organs occupy their usual anatomic positions.

#### RESPIRATORY SYSTEM:

The right and left lungs weigh 850 gm each. The external surfaces are smooth and deep red-purple. The pulmonary parenchyma is diffusely congested and edematous. No mass lesions or areas of consolidation are present.

#### CARDIOVASCULAR SYSTEM:

The 450 gm heart is contained in an intact pericardial sac. The epicardial surface is smooth, with minimal fat investment. The coronary arteries are present in a normal distribution, with a right-dominant pattern. The myocardium is homogenous, red-brown, and firm. The valve leaflets are thin and mobile. The walls of the left and right ventricles are 2.0 and 0.8 cm thick, respectively. The endocardium is smooth and glistening. The aorta gives rise to three intact and patent arch vessels. The renal and mesenteric vessels are unremarkable (see AFIP consultation report below).

#### LIVER & BILLARY SYSTEM:

The 2450 gm liver has an intact, smooth capsule and a sharp anterior border. The parenchyma is tan-brown and congested, with the usual lobular architecture. No mass leasons or other abnormalities are seen. The gallbladder contains a minute amount of green-black bile and no stones. The mucosal surface is green and velvety. The extrahepatic biliary tree is patent.

### 18/07 '04 FRI 12:22 FAX 3013190834

5

# AUTOPSY REPORT ME04-038

#### SPLEEN:

The 360 gm spleen has a smooth, intact, red-purple capsule. The parenchyma is marcon and congested, with distinct Malpighian corpuscles,

#### PANCREAS:

The pancreas is firm and yellow-tan, with the usual jobular architecture. No mass lesions

#### ADRENALS:

27

The right and left adrenal glands are symmetric, with bright yellow cortices and grey medulise. No masses or areas of hemorrhage are identified.

# GENITOURINARY SYSTEM:

The right and left kidneys weigh 220 grams each. The external surfaces are intact and smooth. The cut surfaces are red-tan and congested, with uniformly thick cortices and sharp corticomedullary junctions. The pelves are unremarkable and the ureters are normal in course and caliber. White bladder mucosa overlies an intact bladder wall. The bladder contains no urine. The prostate is normal in size, with lobular, yellow-tan parenchyma. The seminal vesicles are unremarkable. The testes are free of mass losions, contusions, or other abnormalities.

# GASTROINTESTINAL TRACT:

The esophagus is intact and lined by smooth, grey-white mucosa. The stomach contains approximately 30 cc of brown fluid. The gastric wall is intact. The duodenum, loops of small bowel, and colon are unremarkable. The appendix is present.

#### ADDITIONAL PROCEDURES

- Documentary photographs are taken by AFIP photographer.
- Specimens retained for toxicologic testing and/or DNA identification are; blood, spicen, liver, brain, bile,

MICROSCOPIC EXAMINATION

- The disaected organs are forwarded with body
- · Personal effects are released to the appropriate mortuary operations representatives

#### Cassette Summary:

- 1. Right ventricle
- 2. Anterior left ventricle
- 3. Interventricular septum
- 4. Liver

2007

# AUTOPSY REPORT ME04-038

Microscopic Description:

BRAIN: unremarkable.

LUNGS: cosinophilic proteinaceous material within alveolar spaces bilaterally.

HEART: see AFIP consultation below.

LIVER: focal macrovesicular steatosis without inflammation or increased fibrosis.

Bb-2

CARDIOVASCULAR

SPLEEN: autolytic; otherwise unremarkable.

PANCREAS: autolytic; otherwise unremarkable.

KIDNEY: autolytic; otherwise unremarkable.

### CONSULTATION FROM DR. PATHOLOGY DEPARTMENT, ARMED FORCES INSTITUTE OF PATHOLOGY:

Heart: 450 grams; normal epicardial fat; closed foramen ovale, normal left ventricular chamber dimensions: left ventricular cavity dismeter 40 mm, left ventricular free wall thickness 13 mm, ventricular septem thickness 15 mm; right ventricular thickness 4 mm, without gross scars or abnormal fat infiltrates; marked post-mortem decompositional changes, otherwise unremarkable valves, endocardium, and myocardium; histologic changes show multiple foci of interstitial and replacement fibrosis, some of which are associated with lymphocytic infiltrates; a section from the posterior left ventricle shows a subepicardial focus of granulomatous inflammation with central fibrinoid necrosis; special stains including Brown-Brenn, Brown-Hopps, Zichl-Neilsen, GMS, and Warthin-Starry are negative for microorganisms.

Coronary Arteries: Normal ostia; right dominance; focal moderate atherosclerosis: Left main coronary artery: 40% luminal narrowing by pathologic intimal thickening Left anterior descending coronary artery: 60% narrowing of proximal LAD by pathologic intimal thickening; no other significant atherosclerosis.

Diagnosis:

<del>CLU-RDI 1042 p.9</del>

- 1. Myocarditis with focal necrosis and scarring
- 2. Focal moderate coronary atherosclerosis

Comment: In most instances myocarditis is caused by viral organisms, however the histologic appearance in this case is atypical with areas of granulomatous inflammation and fibrinoid necrosis. The granulomas do not have the usual non-necrotizing appearance of sarcoidosis. All special stains for microorganisms are negative. Other possible causes of myocardiitis includes various bacterial, fungal, and Mycobacterial

### AUTOPSY REPORT ME04-038

organisms, and negative stains do not indicate absence of disease. This case was also reviewed by the Infectious Disease Department.

#### **OPINION**

This 25 year-old detaince died as a result of MYOCARDITIS (inflammation of the heart). There is no evidence of significant trauma. The menner of death is NATURAL.
